ABSTRACT

In today’s knowledge-based economy, measurement, management and disclosure of intellectual capital (IC) are very crucial for enhancing business performance and economic growth, both in manufacturing as well as service organizations. This study attempts to provide an insight into the style of IC disclosures and measurements done by the Indian companies. First, a longitudinal study was carried out to analyze how three Indian firms--Reliance Industries Limited, Balrampur Chini Mills and Shree Cement Limited--disclose their IC reports. Second, in order to survey the recent IC measurement scenario, we conducted another study of 8 Indian pharmaceutical companies in which the market value added (MVA) approach is applied for measuring IC on their 2004-05 to 2008-09 annual reports. Also, it seeks to measure the effectiveness of IC as compared to tangible assets (TA) for the selected companies. On an average, the selected pharmaceutical companies reported a positive value of IC: significant correlation has been noticed between TA and net operating profits. However, no significant difference was found between percentage of IC to MV and percentage of TA to MV. The results of longitudinal study confirmed that IC disclosure in these companies is almost negligible and its disclosure had not received any preference from the mentors of these corporations. IC reports may initially be used for ‘internal’ management purposes; but an ‘external’ stakeholder-focus of IC report should be the ultimate goal. Unfortunately, the omission of IC information may adversely influence the quality of decisions made by shareholders, or lead to material misstatements.

Keywords: Disclosure, measurement, intellectual capital, intangible assets, developing country, exploratory study.

INTRODUCTION

Business dynamics of the 21st century are increasingly determined and driven by Intellectual Capital (IC) elements. The future drivers of any modern economy will no longer be capital, land or equipment, but the “people” and their “knowledge” reservoir. A knowledge-intensive company leverages their know-how, innovation and reputation to achieve success in the marketplace (Jose et al., 2010). Market participants, practitioners and regulators alike argue that there is an important need for greater investigation and understanding of IC (or knowledge assets) disclosure as the usefulness of financial information in explaining firm profitability continues to deteriorate. Bukh (2005), for example, asserts that traditional disclosure mechanisms are not able to cope adequately with the disclosure requirements of new economy firms. He observed an increasing dissatisfaction with traditional financial disclosure and its ability to convey to investors the wealth-creation potential of firms.

Various estimates indicate that “intangible” assets currently constitute 60-75% of corporate value, on an average. For example, Lev (2001, 2002) compared the investment pattern of 1929 and 1990 and concluded that “in 1929 among the U.S. companies, approximately 70% of their investment went into tangible assets (TA) and some 30% went to intangible assets. In contrast, in 1990 the trend was reversed. It was found that a major part (67%) of investment goes into intangibles, such as research and development, IT software, education and competences and internet.” Further, he compared that relationship between market value and book value of shares. In 1970 it was 1:1 and in mid-1990 it had increased to an average of three times. This statistical information provided an insight into the growing importance of IC. The socially harmful consequences of the failure to account properly for those assets, and disclose their attributes are numerous and very significant. Some of them are: (a) Using intangibles for widespread manipulation of financial information, (b) Excessive gains to corporate insiders from trading the stock of their companies, (c) High volatility of stock prices, and (d) Excessive cost of capital to intangible-intensive companies, hindering innovation and growth. Therefore, the corporate world is now devoting a lot of time and effort to manage its “intellectual” assets in order to improve
its shareholder’s wealth. Despite growing interest and demand for IC information, prior research till date suggests a persistent and significant variation, both in the ‘quantity’ and ‘quality’ of information reported by firms on this pivotal resource. As existing economic and business metrics track a declining proportion of the real-economy, the deficiency and inconsistency in the disclosure of IC-related information is creating growing information “asymmetry” between ‘informed’ and ‘uninformed’ investors. This provides a fertile ground for informed investors to extract higher abnormal returns (Chiucchi et al., 2008). Thus, IC is increasingly being recognized as having much greater significance in creating and maintaining “competitive” advantage and shareholder “value”. This clearly calls for a refreshed understanding of business principles, information disclosure, and decision-making processes.

The concept of IC measurement, management and disclosure is still relatively new. Accountants, business managers, and policy-makers have still to grapple with its concepts and detailed application. As expected, definition of IC varies substantially. According to Stewart (2002): “It has become standard to say that a company’s IC is the sum of its human capital (talent), structural capital (intellectual property, methodologies, software, documents, and other knowledge artifacts), and customer capital (client relationships).” One of the most comprehensive definitions of IC is offered by the Chartered Institute of Management Accountants (CIMA, 2001): “The possession of knowledge and experience, professional knowledge and skill, good relationships, and technological capacities, which when applied will give organizations competitive advantage.”

An expert opinion, IC is a combination of human capital—the brains, skills, insights, and potential of those in an organization—and structural capital—things like the capital wrapped up in customers, processes, databases, brands, and IT systems. It is the ability to transform knowledge and intangible assets into wealth creating resources, by multiplying human capital with structural capital. For instance, Sveiby (2004) first proposed a classification for IC into three broad areas of intangibles, viz., Human capital, Structural capital and Customer capital—a classification that was later modified and extended by replacing customer capital by relational capital. Some examples of IC are shown in Figure-1. The diagram is only a guide to the components of IC as the elements combine and interact with each other and with traditional capital elements (physical things and monetary elements) in ways unique to individual companies to create value.

The available literature has identified three sub-phenomena (or categories) that constitute the concept of IC: human, relational, and organizational capital. First, “human capital” represents the knowledge, experience and skills of the employees of the firm. It also reflects the commitment and motivation of the employees as a result of their continuance in the firm. Second, “relational capital” reflects the organizational value that emerges not only from a firm’s relations and connections with customers, but also with current and potential suppliers, shareholders, other agents, and the society in general. Finally, “structural capital” shows a firm’s supportive structures for knowledge creation and deployment, as well as, the set of knowledge, skills and abilities embedded in the organizational structure.

In popular belief, IC is associated with “human capital” or “knowledge.” The terms intangible assets, knowledge assets/capital or intellectual assets/capital are often used as synonyms. The term intangible assets can often be found in the accounting literature, whereas the term knowledge assets is used by economists and IC is used in the management and legal literature, but all refer essentially to the same thing: the intangible value contained in the heads and relationships of employees, management staff, customers and other stakeholders. IC encompasses not only the contents of employees’ minds but also the complex intangible structure that surrounds them and makes the organization function.
WHY TO MEASURE INTELLECTUAL CAPITAL?

Companies may want to measure IC for a variety of reasons. One study by Benard (2003) identified the following five main reasons. First, measuring IC can help an organization to formulate business strategy. By identifying and developing its IC, an organization may gain a competitive advantage. Second, measuring IC may lead to the development of key performance indicators that will help evaluate the execution of strategy. IC, even if measured properly, has little value unless it can be linked to the firm’s strategy. Third, IC may be measured to assist in evaluating mergers and acquisitions (M&A), particularly to determine the prices paid by the acquiring firms. Fourth, using non-financial measures of IC can be linked to an organization’s incentive and compensation plan. However, the first four reasons are all internal to the organization. A fifth reason is external: to communicate to external stakeholders’ what intellectual property the firm owns. Daniel Andriesen (2004), for example, proposes a much shorter list of the reasons companies may want to measure IC: to improve internal management, to improve external disclosure, and to satisfy statutory and transactional factors.

Intangible resources need to be managed with more attention and differently than other resources, and measuring them helps to improve management of them. Effective management of intellectual property also helps to measure it. Good measures of IC will compliment financial measures, provide a feedback mechanism for actions, provide information to develop new strategies, assist in weighing different courses of action, and enhance the management of the business as a whole. Improving “external” disclosure of IC can: (1) close the gap between book value and market value, (2) provide improved information about the real value of the organization, (3) reduce information asymmetry, (4) increase the ability to raise capital by providing a valuation on intangibles, and (5) enhance an organization’s reputation. Good measures of IC, of course, will complement financial measures, provide a feedback mechanism for actions, provides information to develop new strategies, assist in weighting different courses of action, and enhance the management of the business as a whole.

The inclusion of an IC in the corporate financial statements would “result in a balance sheet that more realistically describes the value of the company, and displays all relevant assets from which the company expects to obtain benefits in the coming years.” Although this is an appealing idea, unfortunately, it is not per definition of value to the disclosing company. Three favorable factors regarding voluntary disclosure are: lower borrowing costs, higher value relevance, and decreased information asymmetry.

It should be noted that the costs of disclosing IC-related information are certainly not to be ignored. The question is whether corporate managers value the benefits of disclosure properly. Companies incur significant costs in order voluntarily to disclose information and may regard such disclosure as a “service” to shareholders, investors and analysts. When assessing the costs of IC disclosures, one important factor is the cost of gathering and analyzing IC-related data. These costs will be positively correlated to the required detail of this data. When taking the Skandia Navigator as a model, it becomes apparent that hiring specific IC staff is only one necessity. However, three factors opposing IC disclosure are: transparency drawback, regulatory barriers, and auditor conservatism.

ACCOUNTING CONUNDRUM ABOUT IC MEASUREMENT & DISCLOSURE

The expansion of the services-sector, globalization, deregulation, and the emergence of new information and communication technologies have brought to the fore the issue of “how knowledge is created, disseminated, retained and used to obtain economic returns.” This development is associated with a structural change from traditional scale-based manufacturing to new more innovation-intensive activities (Mar et al. 2003). These rely heavily on “intellectual assets” encompassing such elements as research and development, patents, software, human resources, and new organizational structures. In fact, these assets have become strategic factors for value creation by firms. They are increasingly important in enabling productivity and efficiency gains, and are a crucial part of innovation in relation to business processes and products.

Thus, to attain the goals of a business firm “both tangible and intangible assets” are used in this process. However, there is growing criticism that the ‘traditional’ balance sheet does not take into account those ‘intangible’ factors that largely determine a company’s value and its growth prospects. In fact, the real differentiator between one firm and the next is the “readiness of the firm’s intangible assets for converting its tangible assets into cash in the most efficient manner.” This readiness is known as “core competency” and it is the chief source of “competitive” advantage for companies (Jose 2010). In order to be able to manage “intellectual” assets, we have to recognize where this value is coming from and how it is created in an organization. Unfortunately, accounting systems are designed exclusively (with some exceptions) for measuring and reporting “tangible” assets. This creates the phenomena of the “invisible” balance sheet, as shown in Figure-2. Everything that appears below the ‘solid’ horizontal-line represents the “invisible assets of the firm.” This is balanced on the right-hand side by a corresponding “invisible” equity. As stated earlier, ‘market-value’
of most public companies is considerably higher than their corresponding ‘book-value,’ which represents only the ‘tangible’ assets of the firm. Improving “external” disclosure of IC can close this big gap between book value and market value, provide improved information about the real value of the organization, reduce information asymmetry, increase the ability to raise capital by providing a valuation on intangibles, and enhance an organization’s reputation.

The Gartner Group, for example, estimates that “intellectual” assets are worth approximately three-to-four times an enterprise’s book value. The dilemma remains that, even though IC can outweigh physical assets enormously, it is very difficult to find measures that will accurately reflect their value within an instrument, such as the “balance sheet.” In the business world where most of the organizational value is based on intangible assets, the ability to recognize and estimate the sources of this value has become vital for companies. The formation of the discourse on IC is predicated upon the assumption that the traditional double-entry bookkeeping system does not reflect emerging realities. It is an inadequate tool for measuring the value of corporations whose value lies mainly in their intangible components. One way to measure knowledge assumes that the stock market implicitly performs the valuation. In its simplest form, this method accepts “the market to be invariably accurate in its valuations, and that any excess valuation of a company over its book value will be the correct valuation of the company’s intangible assets.” Generally, the relationship between Intellectual Capital and Market Value, in equation form, can be stated as:

\[
\text{Market Value (MV)} = \text{Book Value (BV)} + \text{Intellectual Capital (IC)}
\]

When there is a large disparity between a firm’s “market” value and “book” value, that difference is often attributed to “IC”. Market Value (MV) is, of course, the company’s total shares outstanding times the stock market price of each. However, Book Value (BV) is the excess of total assets over total liabilities. This equation shows that MV has a tangible portion BV, in addition to an intangible component of IC. Hence, supposing MV minus BV is greater than zero (\(\text{MV - BV} > 0\)), it shows that the company needs to make provision for managing and measuring its IC. It can be assumed that the more knowledge-intensive the company is, the greater the IC value will be. The obvious accounting flaw is that the right hand side of the equation does not have a single set of units. “Virtual and real money cannot be added to each other.” The ‘invisible’ equity of a firm can be considerably large depending on how effectively the firm is harnessing its IC. For companies in the service sector, it is disproportionately large in comparison to physical assets. Even for companies in the manufacturing and agriculture sectors, investments in intangible assets is increasing as compared to those in tangible assets, signaling the increasing importance of IC as a key growth driver in the knowledge era. Thus, a long and arduous road still needs to be negotiated before we have reliable measurements for IC.
The Financial Accounting Standards Board’s (FASB, 2001) “Statement of Financial Accounting Standards No. 142, Goodwill and Other Intangible Assets,” provides the accounting basis for measuring intangible assets. An intangible asset that is acquired from an external source is initially recognized at its fair value. If an intangible asset is developed internally, it is recognized as an expense when it is incurred. This will limit the recognition of most IC to what is purchased from outside the organization, such as patents, licenses, and trademarks, because they are the only ones recognized as assets. Generally accepted accounting principles (GAAP) do not recognize a value of human capital nor much of the structural capital, such as internally developed software, patents, and brands. In developing the Statement, the FASB (1984) relied upon the four recognition criteria found in “FASB Concept Statement No. 5, Recognition and Measurement in Financial Statements of Business Enterprises.” These criteria are: (1) The item meets the definition of an asset, (2) the item is measurable with sufficient reliability, (3) the information is capable of making a difference in decisions, and (4) the information indeed represents what it claims to represent, is verifiable, and is neutral. Since IC is a relatively new concept and there is no agreement on how to ‘measure it, many IC items will fail on criterion two (reliability in measurement) and criterion four (verifiability). Until these two criteria can be met, it is doubtful whether many intellectual assets will be included in financial statements. Even so, the amount of IC a firm has can still be conveyed to investors. As there are no generally accepted accounting policies for the presentation of the IC in accounts, this is a field currently under development where everything is left to be done in the coming years. Additionally, there are no standards and/or generally accepted accounting policies for the IC accounting the reliability of IC accounts depends on quality data and accumulation methods (FASB, 2001). Thus, IC does not appear in the traditional financial report.

With the rise of the “knowledge-economy,” IC is becoming more important and should be disclosed. The current bias towards tangible assets in measuring investment may lead to inefficient policymaking, misallocation of resources by managers and increased cost of capital for investors. However, any shift toward consideration of intellectual assets as investments rather than as expenses must overcome a range of measurement and valuation problems. Unfortunately, IC does not appear officially in the traditional financial report. Accountants are not yet ready to make significant changes to a 500-year-old system. Alternative methods of measuring and evaluating IC have been slow to develop. This is because investors, through ignorance or short-sightedness, have continued to value balance sheet information. The various forms of IC disclosure provide valuable information for investors as they help reduce uncertainty about future prospects and facilitate a more precise valuation of the company. However, financial reports fail to reflect such a wide-range of value-creating intangible assets, giving rise to increasing information asymmetry between firms and users, and creating inefficiencies in the resource allocation process within capital markets. Radical change to accounting standards is not viewed as a realistic approach. As a result, new approaches to reporting and supplemental statements stand to contribute more to the information needs of users. New reporting models allow users to focus on specific areas of interest such as human capital and not just intangible assets in general. CSR and environmental reporting have become more broadly accepted by the capital markets as awareness of the related risks grows. Human capital reporting is also becoming increasingly sophisticated with increasingly sophisticated attempts to link measures to financial performance. Traditional statements will continue to have great relevance, though they will increasingly become one element in a broader set of disclosures.

LITERATURE REVIEW

The main IC disclosure and measurement studies were typically cross-sectional and country-specific, although some longitudinal studies have been reported too. Some of the leading IC disclosure studies, widely reported in the literature, were conducted in Australia, UK & Ireland, Sweden, Canada, Malaysia, Sri Lanka, New Zealand, Bangladesh and India. While most studies employed “content analysis” as the research methodology, other studies have used questionnaire surveys (Beattie 2007). Despite the fact that the importance of IC has increased in recent times, there are inadequate disclosures of IC in the financial statements of companies (Bruggen et. al. 2009)

In a review of the current state of financial and external disclosure research, Parker (2007) identified IC accounting as a major area for further research. However, most of the IC disclosure studies were cross-sectional and country-specific. Examples include studies in Australia (e.g. Guthrie and Petty, 2000; Sujan and Abeyesekera, 2007), Ireland (Brennan, 2001), Italy (e.g. Bozzolan et al., 2003), Malaysia (Goh and Lim, 2004), UK (e.g. Williams, 2001), and Canada (Bontis, 2003). Relatively very few longitudinal studies have been reported (e.g. Abeyesekera and Guthrie, 2005). Moreover, some studies focused on the specific aspects of IC disclosure, such as human capital disclosure (e.g. Subbarao and Zeghal, 1997), while others conducted international comparative studies (e.g. Vergauwen and van Alem, 2005; Cerbioni and Parbonetti, 2007). Some IC disclosure studies have looked beyond annual reports to examine other communication channels, such as, analyst presentations.
Studies have also been conducted to explore IC related issues from the firm’s perspective. Chaminade and Roberts (2003) investigate the implementation of IC disclosure systems in Norway and Spain. Habersam and Piper (2003) employed case studies to explore the relevance and awareness of IC in hospitals. Studies that looked at possible determinants of voluntary IC disclosure include García-Meca et al. (2005) and Cerbioni and Parbonetti (2007). Based on analyst presentation reports of listed Spanish companies, García-Meca et al. found significant association between IC disclosure and size and type of disclosure meeting but not ownership diffusion, international listing status, industry type and profitability. Based on analysis of European Biotechnology companies over a period of three years, Cerbioni and Parbonetti (2007) found governance related variables to strongly influence voluntary IC disclosure. Guthrie and Petty’s (2004) analysis of IC disclosure practices suggests that disclosure has been expressed in discursive rather than numerical terms and that little attempt has been made to translate the rhetoric into measures that enable performance of various forms of IC to be evaluated.

Bontis (1998) conducted an empirical pilot study that explores the development of several conceptual measures and models regarding IC and its impact on business performance through principal components analysis (PCA) and partial least squares (PLS) methods. The main findings of study shows that there is valid, reliable and significant link between dimensions of IC and business performance. Brennam and Connell (2000) examined substantial difference between company book value and market value, which indicates the presence of intellectual assets, not recognized and measured in company balance sheets and also provides guidelines to companies for reporting on IC. Maria and Jose Sarabia (2005) proposed a tree organization (TREEOR) model of valuation of IC of organizations based on variation of classical Lotka-Volterra equation system. The proposed model tries to measure IC of an organization to recognize the organizational mechanism of growth in analogy with growth of a tree and incorporates a bifurcation parameter that values to increase organizations IC. Prashanta and Srinivas (2006) measured the value of IC from financial reports of selected companies (viz., Infosys Technologies Ltd., Satyam Computers Ltd. and Dr. Reddy’s Laboratories) and also analyze the reasons for fluctuations in the value of IC of these companies. Market value added approach is adopted for measuring IC.

Bharathi Kamath (2007) measures and evaluates the value added to a firm by its IC using a concept of value added intellectual coefficient (VAIC). The author remarked that value is created only if efficiency of resources is leveraged and value added increase in absolute terms is also not a measure for determining the value creation only if VAIC is increasing then it can be said that value is being created. Bhanawat (2008) measured the IC of companies by applying difference between market value and book value of firm. He found that present system of reporting of intellectual property in companies is not adequate and all selected companies fail to disclose whether an IP is self-developed or acquired. Further, Miguel Angel Axtle Ortiz (2009) analyzes various components of IC through a humanistic model called contextual intellectual capital components valuation model (CONICCCVATM). The sample population in eight geographic regions, 16 types of industries was analyzed using 41 variables and 4 factors through multiple analysis of variances (MANOVA) methodology. The author concluded that only companies inserted in equivalents contexts could be compared and demonstrates the importance of the context in valuation of IC. In light of the above review of literature, an attempt has been made in present study to revisit the analysis of IC by market value added method.

India presents an ideal case for the analysis of IC disclosures by the IT companies because the economy has been undergoing rapid economic transformation in the financial services, tourism, IT sectors and the niche manufacturing gaining momentum. In the Indian-context, there has been very limited number of IC disclosure studies, as compared to its European counterparts. However, two recent studies are available on IC disclosure in India using content analysis, which were done by Kamath (2008), and Joshi et al. (2009). The foregoing discussion suggests that the literature on the determinants of IC disclosure in Indian-context is very limited and inconclusive. Thus, our study builds on the previous literature of IC disclosure practice and overall IC disclosure scenario in the Indian corporate sector, especially pharmaceutical firms. The scope of the study has been confined to 8 companies and a market value added approach was used on their annual reports for five years, namely, 2004-05 and 2008-09 respectively.

**RESEARCH METHODOLOGY USED**

Due to lack of “regional” research on IC disclosures in India, we first decided to focus on a “longitudinal” study of IC reports published by the Indian pioneer firms. After some initial research on business and intangible resources in the Indian companies, we found that three companies had published their first IC reports in 1997, which were discontinued later on. These firms are: Balrampur Chini Mills Limited, Reliance Industries Limited,
and Shree Cement Limited. After some initial difficulties, we collected copies of IC reports published by these firms. The aim was to study the idiosyncrasy of the reports built in the Indian subcontinent.

This research also aims at mapping the current state of IC measurement in the Indian scenario. Market value added approach (MVA), as a research methodology, is adopted for measuring IC of the 8 pharmaceutical companies in India. Accordingly, the sample-size of this study consists of the following eight pharmaceutical companies: Aventis Pharma Ltd., Dr. Reddy’s Laboratories Ltd., Novartis Ltd, Aurobindo Pharma Ltd, Torrent Ltd., Sun Pharma Ltd, Cipla Ltd., and Cadila Ltd. The electronic/soft copies of the annual reports for these selected companies were obtained for five years, 2004-05 and 2008-09 from their respective corporate Websites. The relevant data required for present research study have also been collected from the electronic database ‘Prowess’ provided by the Centre for Monitoring Indian Economy (CIME). We feel the period of 5 years seems to be sufficient to analyze and establish the trend of IC of selected companies.

Moreover, under the present study, various statistical techniques like mean, percentage, correlation, coefficient of variation (C.V.) and probable errors (P.E.) are used to analyze the data. More specifically, the objectives of this study are to: (a) measure IC in monetary terms for sample units, (b) examine the relationship of IC and tangible assets with net operating profit, and (c) examine effectiveness of IC over tangible assets. Hypotheses used are: (a) there is no relationship between IC and net operating profit, and (b) there is no difference between percentage of IC to market value and percentage of tangible assets to market value.

IC DISCLOSURE SCENARIO IN INDIA: A LONGITUDINAL STUDY

With the rise of the “knowledge economy,” the management of IC is becoming even more important and, therefore, it should be disclosed in the annual reports. In the knowledge-based economy, therefore, most of the organizations have realized that the true potential of creating value for their organizations lies in the measurement, valuation, and disclosure of their IC (Jing et al., 2007). Attracted by the lack of “regional” research on IC disclosures in India, we decided to focus on a “longitudinal” study of IC reports published by the pioneer Indian firms. After some initial research on business and intangible resources in the Indian companies, we found that three private-sector companies had published their first IC report in the year 1997. These firms are Balrampur Chini Mills Limited, Reliance Industries Limited, and Shree Cement Limited. After some initial difficulties, we collected IC reports published by these firms. The aim was to study the “idiosyncrasy of the reports built in the Indian subcontinent.” Why did these firms decide to build this innovative report? The reason is that the IC report contributes to the management of intangible resources, and also provides the shareholders’ with a “holistic” picture of the organizational resources. Let us study the experience of three leading firms, which had taken the lead by providing IC-related disclosures, so as to learn some valuable lessons from them.

(a) Balrampur Chini Mills Limited: The Balrampur Chini Mills Limited (visit www.chini.com) is one of India’s largest sugar companies, with three factories in Uttar Pradesh. In addition to the core sugar business, the company also produces and sells molasses and alcohol. In the 1996-97 Annual Report, the firm elaborates about the rationale of IC and intangible report as: “to provide share owner a different and broader perspective of the company, and the fundamentals that drive its business.” The Balrampur Model is specific to the company (1997-98) as “it reflects our priorities, our method of working, our attitude and our people.” If successfully activated, this model becomes regenerative. As the company states in its 1998-99 report, “As we keep this intellectual capital wheel in motion, the Balrampur will always be a growing company.” According to the firm, the five elements of IC are: credibility, efficiency, human, structural, and customer capital. Customer capital has a strategic importance for the firm. As it states, “This is the apex of Balrampur’s intellectual capital model. All the expertise built up on the manufacturing and marketing sides of the business is eventually judged on the ability of the company to produce sugar of acceptable quality.” Moreover, the company stresses the benefits of valuing brands. The ability to outperform the sugar industry average is a reflection of the considerable intellectual capital that it has built into its business—at the farm, factory and marketing levels. The Balrampur Chini Mills’ ICR constitutes an independent document to the annual report. These reports had 11 pages (1996-1997), 24 (1997-1998), 48 (1999-2000) and 40 (2000-2001), respectively.

(b) Reliance Industries Limited: The Reliance Industries Limited (RIL) activities include exploration and production of oil and gas, refining and marketing, power, telecommunications, petrochemicals, textiles, financial services and insurance, and infocom initiatives. It has emerged as India’s most admired business house, for the third successive year in a TNS Mode survey for 2003. The Reliance’s employee skills are its competitive muscle. Its skills differentiate Reliance from its competitors—whether it be through the speedier implementation of a project or in its implementation at a cost which is significantly lower than that of the competition, or in the ability to extract more out of capital equipment, even when it ages. These skills are germinated in the Reliance culture.
The ICR of RIL (www.ril.com) aims to: “redress the imbalance between non-financial and financial data, in recognition of the belief that value of organizations will, in times to come, increasingly reside in their intangible assets.” (1998) The ICR is just focused on intellectual capital and addresses several key topics: the importance of the IC report itself, IC and value creation, human capital, structural capital, customer capital, and investor capital. However, it does not address the business model. It constitutes an independent document from the annual report with a total of 20 pages. The firm recognizes that “the development and the use of human potential and a learning organization is Reliance’s bridge to continued success in the future.” It uses the term “customer capital” not “relational capital” as most firms do. In this area, variables that matter are market creation, quality of customers, customer retention and growth, market share and the quality factor. Regarding structural capital, the firm admits that it must develop an organizational capability covering “strategy, speed of decision processes, ability to raise funds and prioritization…Organizational ability covers system architecture, the business process (horizontal integration), people processes, as well as, education, learning and knowledge building.” Finally, investor capital was the growth engine of Reliance. In this section (1998), the firm discusses issues focused on institutional shareholding, return to investors, stability in ownership, awareness initiatives, investor education and investor servicing.

(c) Shree Cement Limited: The Shree Cement Limited (visit www.shreecementltd.com) is operating in the cement industry, which possesses two cement plants at Beawar, Rajasthan. It also has one of the few R&D centres in the Indian cement industry. It has a worldwide reputation for maximizing capacity utilization and low energy consumption level. Shree Cement Limited’s IC report is an independent document (having 28 pages) that constitutes a ‘Supplement’ to the Annual Report 2001. The firm understands that IC is “capturing our various experiences for organizational benefit, cross-pollinating our collective knowledge across various operational tiers, maximizing output with the minimum of resources, and doing things right the first time.” The Company’s IC resides in its own employees. Thus, the firm has retained the majority of its members possessing valuable technical, financial and manufacturing skills. Shree Cement Limited’s drivers of excellence have an intangible nature. As it recognizes, they are: “an achievement-oriented culture, continuous innovation, widespread employee participation, sustained plant modernization, cross-functional information sharing, constructive dissatisfaction, personal pride in collective achievement, a family work culture, operational discipline, caring management, aggressive empowerment, reward and recognition system, workplace enthusiasm, mix of youth and experience, informal environment, spirit of “must do”, and quality obsession.” The ICR of the firm is in “narrative style” as it does not incorporate double-entry tables with indicators for its intellectual capital.

There is a vast difference in the disclosure mechanisms and methodology followed by the Indian corporations. In this context, Dr. Kamath (2008) lucidly concludes as: “Some firms have been considering IC as an inseparable part of their total assets and disclosed it in their annual reports as ICR using the standard disclosure models. And, others publish those reports as a supplement to their annual reports, and some others give the details of growth in their IC over the previous period in a separate section in their annual report.” There is no doubt that in India, IC disclosure is still in its “evolutionary” stages and all the three means of disclosure are accepted. Moreover, we appreciate the growing awareness and attempts made by some leading IT companies to disclose IC in their annual reports.

The Indian ICR does not focus on any business model, values, mission and vision, and/or knowledge management issues, as is the case with the European ICR. It presents information in a “narrative” style: it describes a firm’s IC and analyses its components without focusing extensively on specific indicators that measure these components. This is a major distinctive feature of Indian ICR. In sharp contrast with the European Union ICR, Indian reports do not combine a “narrative” and “quantifying” style (Abeysekera 2007). All Indian ICR analyzed in this study constitute an “independent” document that “complement” the Annual Reports. However, their length is much larger than the European Union reports. It is clear that companies in the European Union are way ahead of their counterparts elsewhere when it comes to the measurement, disclosure and management of their IC (Andriessen 2004). Finally, one of the firms in this study—Reliance Industries Limited—even created a specific term for investor relations (the investor capital) and provides an in-depth analysis of this capital.

MEASUREMENTS OF IC BY PHARMACEUTICAL COMPANIES IN INDIA: ANALYSIS OF RESULTS
In the knowledge economy, most of the organizations have realized that the true potential of creating value for their organization lies in the measurement, valuation and disclosure of their IC. Therefore, measurement and disclosure of IC is no more a choice but imperative for the IC driven firm’s performance. This research also aims at mapping the current state of IC measurement in the Indian scenario. Market value added approach (MVA), as a research methodology, is adopted for measuring IC of the eight Indian pharmaceutical companies.
over a period of five years from 2004-05 to 2008-09. In the present study, the IC of all the 8 selected companies has been calculated by applying Market Value Added (MVA) approach. Thereafter, the relationship of the IC and tangible assets with the net operating profits (NOP) has been discussed in terms of coefficient of correlation. Last but not the least, the effectiveness of IC over tangible assets has been examined through t-tests. Table-1 shows the measurement of IC of selected companies from Indian pharmaceutical industry.

| Coefficient of Variance (C.V.) | 97.13 | 161.02 | 153.07 | 173.02 | 214.90 | 159.83 | -- |

Table-1 shows the IC of eight selected companies during the five years from 2004-05 to 2008-09. The fluctuating trend in the amount of IC has been observed during the entire period of study among all the pharmaceutical companies. The highest absolute ‘average’ amount of IC has been reported by the Sun Pharma Limited (Rs. 11,998.1 crores) followed by Cipla Limited (Rs. 9,325.93 crores). Dr. Reddy’s Laboratories Limited was the only company, which could not create sufficient size of IC as compared to other companies. It reported not only least amount of average IC but negative value (Rs. -134.37 crores). The Indian pharmaceutical sector reported “an overall average amount of IC of Rs. 3065.15 crores during 2004-05 to 2008-09.” There is considerable variation observed among the average amount of IC of selected companies during five years. The year 2008-09 may be considered as good year for the shareholders of Indian pharmaceutical sector because this year reported highest average amount of IC (Rs. 3,905.29 crores). By and large, an increasing trend in the average amount of IC from 2004-05 to 2008-09 has been observed, except in 2006-07. The dispersion among the selected companies has been measured in terms of range, which comes to Rs. 12,132.47 crores [9,325.93(-134.37)].

As far as consistency of average amount of IC reported by the eight selected companies is concerned, coefficient of variation of each company has been measured. The biggest inconsistency has been noticed in the case of Aurobindo Pharma Limited, as it is evident by its highest coefficient of variation (1943.43). Similarly, least amount of fluctuation has been observed in Aventis Pharma Limited with least amount of positive coefficient of variation (33.19).

Table-2 shows the correlation analysis of IC and tangible assets with net operating profit, and examines the relationship of IC and tangible assets with net operating profit. There is a ‘positive’ correlation between tangible assets of companies and net operating profit, while ‘negative’ correlation is found between IC and net operating profit. Out of 8 companies selected, only Sun Pharma Limited (0.98, 0.98) and Cipla Limited (0.33, 0.92) have net operating profit positively correlated with both IC and tangible assets. In sharp contrast to this, all other companies are negatively correlated with IC and net operating profit. However, the average coefficient of correlation of IC and NOP is (-0.26), while the average coefficient of correlation of Tangible assets and NOP is (0.85) during the study period. Further more, Probable Error (PE) based test of significance have been applied, which revealed that significant correlation exists between tangible assets and net operating profit, while no significant correlation exists between IC and NOP.

The effectiveness of IC over tangible assets of selected companies is shown in Table-3. It shows IC and tangible assets to market value expressed in terms of percentage. The inner brackets in the above table represents tangible assets to market value in percentage. The highest average percentage of IC to market value during the 5 years period of study is noticed in Sun Pharma Limited (77.6%), followed by Aventis Pharma Limited (74.4%), Novartis Pharma Limited (71.4%), and Cipla Limited (71.2%), respectively. However, negative IC to market value is reported by Dr. Reddy’s Laboratories Limited (-4%) and Aurbindo Pharma Limited (-7.4%).

</table>

Calculated t-test value = 0.53

Table value (5% level of significance at 14 d.f) = 2.15

On an average basis, the overall pharmaceutical industry reported 41.25% of IC to market value, and 58.75% of tangible assets to market value. So, it very clearly indicates that tangible assets are more powerful as compared to IC. On making year-wise analysis, it is further observed that there is a declining trend in IC to market value ratio throughout the study period, except in the year 2005-06 where ratio is slightly increased. The highest IC to market value ratio is noticed in the year 2005-06 with 52%, while least ratio is noticed in the year 2008-09 with 19%. Further, the highest tangible asset to market value ratio is observed in the year 2008-09 with 81% and the least in the year 2005-06 with 48%.

Further, to in order to examine the hypothesis that there is no significant difference between mean values of IC & T.A. to M.V. (in percentage), a t-test has been administered (see Table-3). The calculated value of t-test is derived at (0.533) where table value at 5% level of significance at 14 d.f. is (2.15). So, our null hypothesis is accepted because calculated value is less than table value, which clearly indicates that there is no significant difference between % of IC and tangible assets to market value (MV). The small visible difference is only due to sampling fluctuations and not due to any major reason.

CONCLUSION

In the modern era of global competitiveness, “IC has emerged as a strategic tool that adds value to the organization and gives a realistic picture to the stakeholders and potential investors about performance of the firm, which in turn support the corporate goal of enhancing shareholder value.” As a result, organizations are shifting their focus to measurement, disclosure and management of IC, their most valuable assets. The IC of a firm is its possession of knowledge applied experience, organizational technology, customer relationships and professional skills that provide it with a competitive edge in the market. It is the intellectual material, knowledge, information, intellectual property and experience that can be put to use to create wealth. Thus, the particular focus is to measure the organization’s IC so that contribution of intangibles to the business are
measured in their own right, if measurement is feasible in practice, they will render the tangible as well as intangible assets of a company to be managed explicitly.

The IC of a firm is “the sum total of its human capital, structural capital and relational capital.” These assets together form a source of distinct competitive advantage and distinguish the performance of one firm from the other. Having control on such assets enables effective internal governance, on the one hand, and succinct external communications, on the other. Hence it makes sense for firms to measure, monitor and report their IC. In order to be able to manage intellectual assets we have to recognize where this value is coming from and how it is created in an organization. The evaluation methods of the IC will become absolutely necessary in the future in order to explain the way in which the IC creates value. “Top companies will change the focus on the performance measuring systems elaborated in the past century because these are no longer relevant in today’s economy.” Ideas and information matter more than capital. Organization’s managers are obliged to take the initiative of measuring, managing and distribute the IC information referring to the way in which the organization generated value for stakeholders, employees, clients and the rest of investors. When organizations decide to start measuring IC, the reasons behind the decision can vary, but can be classified into two groups: internally oriented and externally oriented. Often, external reasons such as better public image, an increase in market value, reducing the difference between market and book value, additional information for potential investors and the market are more important then the internal benefits when realizing its influence on decision-making, overall business success, the connection between investments in intangibles and business goals as well as the necessity to manage them (Skyrme 2003).

Unfortunately, accounting, as it is currently practiced, has lost much of its ability to inform as businesses have become more and more knowledge intensive. Intangible assets are now variously estimated to currently constitute 60-75 percent of corporate value, on average (Lev, 2002). Research to date has yet to conclude how best to measure this intellectual capital. Current debates about IC are part of the search for a methodology to measure the knowledge base of a firm. This is critical since a failure to properly conceptualize the nature and value of knowledge assets condemns firms and whole economies to fight competitive battles with outdated weapons and tactics. The following conclusions can be drawn from above analysis and discussions: (a) The Indian pharmaceutical industry reported on an average (based on five years) amount of IC of Rs. 3065.15 crores, (b) The highest absolute average amount of IC has been reported by Sun Pharma Limited (Rs. 11,998.1 crores) while lowest average IC reported by Dr. Reddy’s Laboratories Limited (Rs. -134.37 crores), (c) Significant correlation has been identified between tangible assets and net operating profit while not significant correlation between IC and net operating profit, as it is evident by P.E. based test of significance, and (d) There is no significant difference between percentage of IC and tangible assets and percentage of tangible assets to market value as evident by t-test. So, null hypothesis is accepted.

The International Accounting Standards Committee and its national counterparts face a challenge in setting standards for IC disclosure. The measurement examples thus far have been too firm-specific and no set of indicators could hope to be general enough to encompass the needs of a variety of international and industry settings. Auditing all of the different frameworks at this point would be pointless. In fact, pursuing standards at this point might be more harmful given the nascent stage of research development. Voluntary disclosure is the only solution in the short-term. In the long-term, it will be up to the demands of the capital markets. If shareholders and analysts agree that IC disclosure is beneficial in explaining business performance, than companies will have no choice but to appease their audience. In the meantime, academic researchers must continue to push the envelope on empirically-based studies so as to support the growing numbers of early adopters.
